

Ticket Analysis Report – Summary & Key Insights

Overview

The dataset consists of **12 customer support tickets**, including 10 original entries and 2 newly added tickets. Each ticket captures customer details, issue descriptions, and priority levels. After data cleaning and analysis, meaningful patterns and insights were derived to understand customer concerns and service performance.

Data Cleaning & Standardization

All issue descriptions were processed to improve consistency:

- Removed punctuation and extra spaces
- Converted text to lowercase
- Standardized wording (e.g., “ok” → “okay”)

This ensured **uniform data**, enabling accurate keyword analysis and comparisons.

Priority Distribution

- **High Priority:** 5 tickets
- **Medium Priority:** 4 tickets
- **Low Priority:** 3 tickets

Keyword-Based Insights

Keyword frequency across issue descriptions:

- “poor” → 3 occurrences
- “slow” → 3 occurrences
- “good” → 2 occurrences
- “excellent” → 2 occurrences

Unique Word Analysis

- **Total Unique Words:** 31
- **Examples:** internet, slow, poor, service, support, excellent, response

Insights Derived

- **Network-related issues** (internet, slow response) are the most common complaints
- **Service quality** is inconsistent, with both positive and negative feedback present
- High-priority tickets dominate, indicating **urgent operational concerns**
- Cleaned and structured data enables reliable analysis and better decision-making

Conclusion

- The analysis reveals that improving **system performance (speed, connectivity)** and ensuring **consistent service quality** should be the primary focus areas.
